Loading a Sample Data File

Before creating your repagination rules you need a sample data file open. If FTDesign had a sample data file loaded it is displayed, otherwise open a sample data file. You can change the sample data file at any time by opening a new sample data file.

To open a sample data file to create your repagination rules with:

- Select **Open Data File** from the **File** menu or click the **Open** data file tool button on the toolbar.
- The **Open** dialog box opens. **Browse** and select the sample data file you wish to open.
- Select one of the **Ascii/Unicode conversion** options. **Auto** is the normal option.

- Your sample data file will now be loaded into the **Mapping window** of the FormTrap Repaginator.
