Creating Page Elements

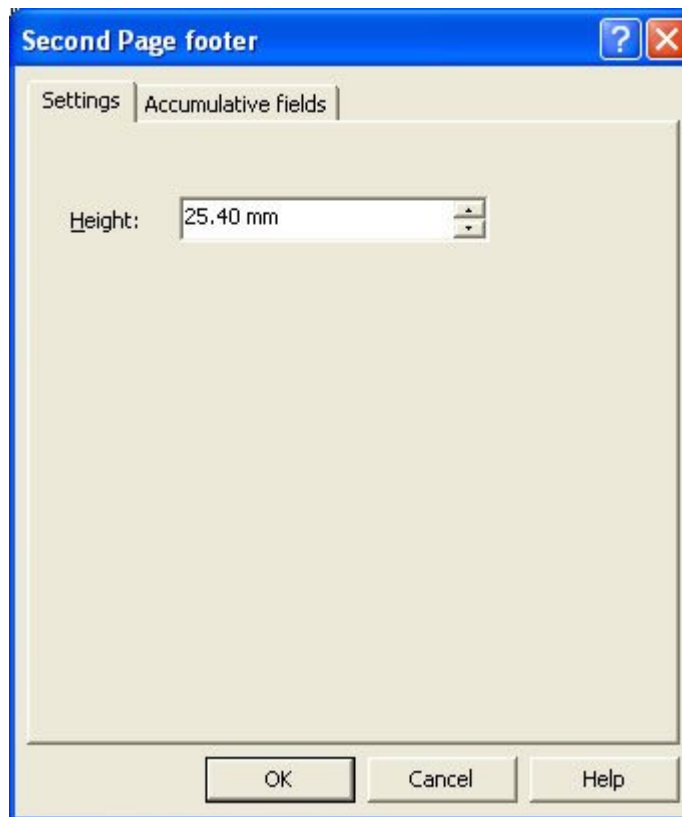

Second Page Footer

The Second Page footer is a special footer that will be printed on the second page only. If defined, it replaces the Page footer on the second page and is typically used for duplex documents, allowing you to have further customization.

To define a Second Page footer:

- Select Second Page footer from the Define menu.
- On the Settings tab set:
 - Height - height for the Second Page footer.
- On the [Accumulative fields](#) tab, create a new accumulative field if not already defined.
